Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Alitalo K., Achen M.G.;  **Biosynthesis of vascular endothelial growth factor-D involves proteolytic processing which generates non-covalent homodimers.";  J. Biol. Chem. 274.32127-32136(1999).  -!- FUNCTION: Growth factor active in angiogenesis, lymphangiogenesis and endothelial cell growth, stimulating their proliferation and migration and also has effects on the permeability of blood vessels. May function in the formation of the venous and lymphatic vascular systems during embryogenesis, and also in the maintenance of differentiated lymphatic endothelium in adults. Binds and activates VEGFR-2 (FIkl) and VEGFR-3 (FIt4) receptors.  -!- SUBUNIT: Homodimer; non-covalent and antiparallel.	=9811 .G., K., ar er = kir atl. atl. 1NG, ING, ING, S.A.	SEQUENCE FROM N.A. VEGF-D first form an antiparallel homodimer linked by disulfide bonds before secretion. The fully processed VEGF-D is composed mostly of two VEGF homology domains (VHDs) bound by non-covalent interactions.

Biophys. Res. Commun. 161:851-858(1989). FUNCTION: Growth factor active in angiogenesis, vasculogenesis endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Fit-1 and VEGFR2/Kdr receptors and to heparan sulfate and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       heparin (By similarity). SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ALTERNATIVE PRODUCTS: 2 isoforms; alpha (shown here) and beta;

PTM: Undergoes a complex proteolytic maturation which generates a variety of processed secreted forms with increased activity towar vectors and vector-2. Vector-b first form an antiparallel homodimer linked by disulfide bonds before secretion. The fully processed vector-b is composed mostly of two Vector-bomodiogy domains (VHDs) bound by non-covalent interactions (By similarity).

SIMILARITY: BELONGS TO THE PDGF/VEGF FAMILY OF GROWTH FACTORS.
                                                                                                                                                                                                                                                                                                     Local Similarity

TISSUE SPECIFICITY: In developing embryos, expressed mainly in choroid placus, paraventricular neuroepithelium, placenta and kidney glomeruli. Also found in bronchial epithelium, adrenal gland and in seminiferous tubbles of testis. High expression of VEGF continues in kidney glomeruli and choroid placus in adulti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SIMILARITY: BELONGS TO THE PDGF/VEGF FAMILY OF GROWTH FACTORS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             remains cell-surface associated unless released by heparin. ALTERNATIVE PRODUCTS: 3 isoforms; VEGF-3/VEGF188 (shown here), VEGF-1/VEGF164 and VEGF-2/VEGF120; are produced by alternative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          endothelial cell growth. It induces endothelial cell growth. It induces endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Fit-1 and VEGFR2/Kdr receptors and to heparan sulfate and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               with PIGF (By similarity).
SUBCELLULAR LOCATION: VEGF-1 and VEGF-2 are secreted while VEGF-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                heparin (By similarity).
SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             S37052; AAB22252.1; -. "Purification and characterization of a naturally occurring vascular endothelial growth factor placenta growth factor heterodimer.";

J. Biol. Chem. 270:7717-7723(1995).

-I- FUNCTION: Growth factor active in angiogenesis, vasculogenesis an endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFRI/FIt-1 and VEGFRZ/Kdr receptors and to heparan sulfate and

with PIGF (By similarity).

SUBCELLULAR LOCATION: VEGF-A120 is acidic and freely secreted.

SUBCELLULAR LOCATION: VEGF-A120 is acidic and freely secreted.

VEGF-A164 is more basic, has heparin-binding properties and, although a signicant proportion remains cell-associated, most is freely secreted. VEGF-A188 is very basic; it is cell-associated freely secreted and is bound avidly by heparin and the

"Cloning of cDNA and high-level expression of equine vascular endotherial growth factor (VEGF).";
submitted (JAN-2001) to the EMBL/GenBank/DDBJ databases.
-i-FUNCTION: Growth factor active in angiogenesis, and endothel cell growth. Induces endothelial proliferation and vascular permeability (By similarity).
-i-SUBGELLULAR LOCATION: Secreted but remains associated to cell-
                                                                                                                                                                                                                                                                                                                                                                                                                                                          DISULFID

It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Fit-1 and VEGFR2/Kdr receptors and to heparan sulfate an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              similarity).

Submitted (MAR-1999) to the EMBL/GenBank/DDBJ databases.

-I- FUNCTION: Growth factor active in angiogenesis, vasculogenesis endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Fit-1 and VEGFR2/Kdr receptors and to heparan sulfate an

with PIGF (By similarity).

-!- SUBCLIULAR LOCATION: VEGF121 is acidic and freely secreted.

VEGF165 is more basic, has heparin-binding properties and,
although a signicant proportion remains cell-associated, most is
freely secreted. VEGF189; is very basic; it is cell-associated
after secretion and is bound avidly by heparin and the
extracellular matrix, although it may be released as a soluble
form by heparin, heparinase or plasmin.

-!- ALTERNATIVE PRODUCTS: 7 isoforms; VEGF106 (shown here), VEGF189,
VEGF183, VEGF165/VEGF, VEGF148, VEGF145 and VEGF121; may be
produced by alternative splicing.

-!- TISSUE SPECIFICITY: The VEGF189, VEGF-165 and VEGF-121 isoforms
are widely expressed, whereas the VEGF206 and VEGF-145 are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        proliferation of endothelial cells via the VEGF-2 receptor. FASEB J. 15:1667-1669(2001).

FINCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFRIFTL-1 and VEGFR2/Kdr receptors and to heparan sulfate and heparin. Neuropilin-1 binds isoforms VEGF-165 and VEGF-145.

1- SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer
                                                                                                                                            This SWISS-PROT entry is copyright. It is produced through a collaboration

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ger-228 producing an heterotetramer. The next extracellular step of the processing removes the N-terminal propeptide. Finally the mature VEGF-C is composed mostly of two VEGF homology domains (VHDs) bound by non-covalent interactions (By similarity).
                                                                                                                                             1 CCNEESLIC 9

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC amino acids VallOl-Thr 173, used together with the C-terminal growth factor)
CC amino acids VallOl-Thr 173, used together with the C-terminal 23
CC residues of VEGF to make a hybrid theoretical molecule for 3
CC dimensional modelling. The sequence is used in a method of producing
CC a monomeric monocyclic peptide by a measuring beta-beta carbon separation
CC distances on opposite antiparallel strands of a peptide loop fragment
CC from an exposed loop of a growth factor protein and cyclising the peptide
CC bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic
CC peptide with at least one amino acid deleted prior to cyclisation are
CC used to interfere with angiogenesis, neovascularisation or
CC lymphangiogenesis in a mammal with a condition characterised by
CC angiogenesis, neovascularisation or lymphangiogenesis. The condition is
CC diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised
CC malignant or benign tumour, post-recovery cerebrovascular accident,
CC post-angiophasty restenosis, head, heat or cold trauma, substance-induced
CC neovascularisation of the liver, excessive hormone-related angiogenic
CC dysfunction, diabetes induced neovascular sequelae, hypertension induced
CC neovascularisation of the liver, excessive hormone-related angiogenic
CC used to modulate vascular permeability in a mammal (the mammal has a
CC condition characterised by fluid accumulation in peripheral limbs or in
CC image blood vessels and lymphatic vasculature. The monomeric and bicyclic
CC peptides are used to interfere with at least one biological activity
CC induced by VEGF, VEGF-C or -D and are also used in combination with an
CC anti-inflammatory agent, to treat a chronic inflammation, especially
CC returnation accumulation of the peripheral limbs or in
CC induced by VEGF, vEGF-C or -D and are also used in combination with an
                                                                                                                                                                                                                                                                                                                                                                  Matches

The sequence is used in a method of producing a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, neovascularisation or lymphanglogenesis in a mammal with a condition characterised by
                                                                                                                                                                                                                                                                                                                                                                                                      neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. Or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and diabetic retinopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC This sequence represents a 109 amino acid truncated human VEGF-D CC (vascular endothelial growth factor D), lacking both the N- and CC C-terminal regions. The invention relates to a monoclonal antibody, or CC fragments thereof, which is specifically reactive with the truncated CC human VEGF-D, and methods of preparing the antibody. The antibody of the convention interferes with the binding of VEGF-D to the VEGF receptors CC VEGFR-2 and VEGFR-3, but does not interfere with the binding of VEGF to CC these receptors and additionally is not reactive with VEGF-C. The CC antibody may be used to treat disorders associated with vascular CC permeability, endothelial cell proliferation, angiogenesis, collar permeability, endothelial cell proliferation, angiogenesis, and CC lymphangiogenesis, neovascularisation and endothelial cell arthropathies. The antibody may also be used to treat fluid accumulation collar heart and/or lung via modulation of vascular permeability. It may additionally be used to detect VEGF-D and may be used to image lymphantic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;
